Coherent Systems CoSy.com Conic All Connect

- **800 ft (250m) across , 1600 (500m) or more tall .**
Currently the twin Towers of Kuala Lumpur , Malaysia are the world's tallest buildings . The base of the Spire of Commerce would span the World Trade Center site ; the structure forming a protective frame within which crystalline buildings are formed by dropping verticals from intersections of the shell at various levels (see plan view below)
- **Strong :** The "All Connect" graph or mandala connects every corner to every other . Therefore each corner radiates loads to all others providing a strong shell protecting the structures within .
- **Unifying :** The space , the building and the monument are one . Around the core buildings , the 12 (or 24) fold symmetry of the All Connect marks the the points of the compass and the hours of the day , and contains the rectangular and hexagonal symmetries of major religions .
- **Straight forward construction :** The drawings here are composed of the 492 lines or beams making up the "parts list" of the structural model . The patent pending algorithms which generate it can be interfaced with standard engineering design systems .

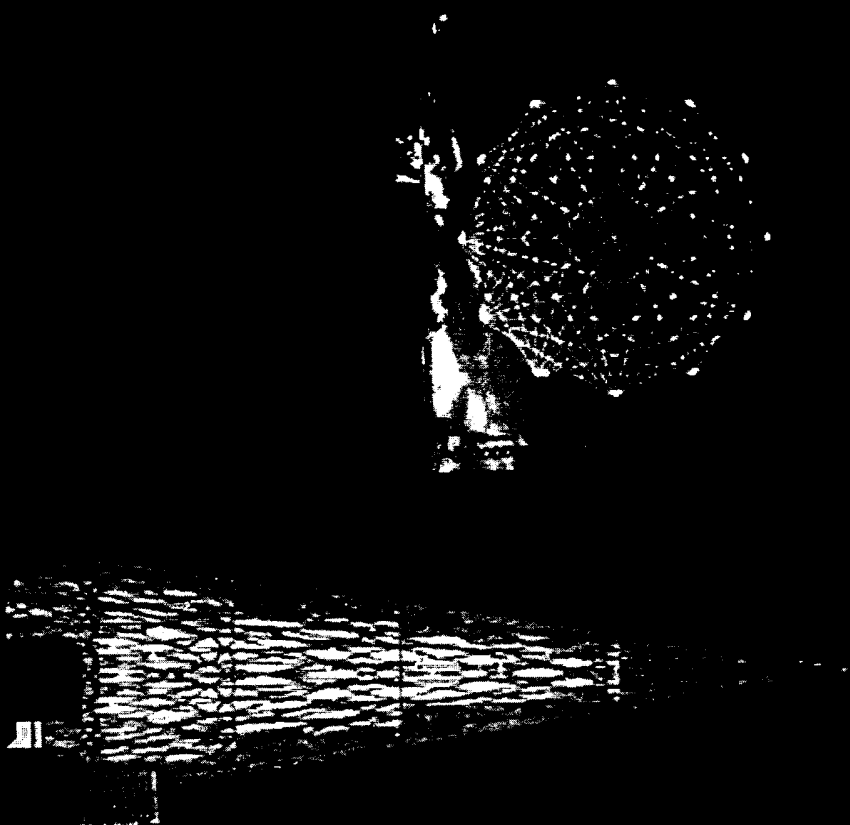

One night more than a month of weekends ago , unbidden , this notion coalesced for a monumental structure fitting the requirements of reasserting the global competence of our neighborhood , and honoring my friends John Perry and big George , the WTC engineer who's overdue at John Street Bar & Grill .

I am only what might be called a mathematical programmer . All I have to offer is this skeleton of a shell . Making it real will require real architects and engineers . If you have talents , resources and interest in working to flesh out this notion into a globally competitive proposal , please get in touch . Bob Armstrong 20021101

Note : I reserve the right to post all communications I receive or generate to CoSy website for further reflection .
